BrightCloud®
Mobile Security SDK

Simple, flexible, powerful detection and protection for Android® devices

Overview
• Malicious apps and PUAs are a threat to personal and corporate data, and can compromise financial transactions
• In 2019, Trojans accounted for 56.9% of Android threats detected
• The BrightCloud Mobile Security SDK offers enhanced mobile security, including antivirus, antimalware, application scanning and interrogation, device root detection, and device risk scoring

Individuals using smartphones and tablets tend to engage in activities that increase the risk of attacks on themselves and networks. For instance, using unsecured public WiFi or downloading apps from untrustworthy third-party sites can infect a device with mobile malware. These could lead to unwanted consequences, including data exfiltration, camera and microphone hijacking, financial extortion, or acting as a Trojan horse into the WiFi network it connects to.

Webroot detects a variety of malicious apps, including malware, spyware, and trojans. PUAs include commercial rooting tools, hacking tools, aggressive advertising, and data leakage apps. Security administrators may consider eliminating PUAs, as they have the potential to impact data loss or incur unwanted mobile usage fees.

The BrightCloud Mobile Security SDK addresses mobile device threats by enabling technology partners to offer enhanced mobile security for their customers within their solutions. It features antivirus, antimalware, application scanning and interrogation, device root detection, and device risk scoring, all while utilizing very little memory, bandwidth, or battery life. As a fully functional mobile security solution, it offers significantly better protection than a simple, static block list approach and is designed to stay ahead of today's mobile threats.

Partner Benefits
• Differentiate yourself from your competition
  Offer your customers industry-leading detection and protection against mobile threats
• Leverage Webroot BrightCloud Threat Intelligence
  Harness collective threat intelligence from millions of sources via the world’s most powerful cloud-based security network
• Easy integration gives you full control
  Simple, UI-less integration puts your brand at the forefront of the user experience
• No impact on user experience
  Powerful protection with a tiny footprint and minimal battery drain to satisfy your customers
**BrightCloud® Mobile Security SDK in Action**

The BrightCloud Mobile Security SDK enables our technology partners to monitor Android devices, check for malicious apps, act on threats, and check overall device status.

**Device Scanning**

The SDK scans the device to detect threats when either initiated by the user or triggered by events occurring on the device. Additionally, the SDK proactively scans at set intervals to ensure changes do not go unnoticed. This multi-pronged approach offers optimal protection for the user from viruses and malware, while not impacting their experience using the device. Results can be integrated into the host application for visibility of overall protection status, and extended detection details can be requested for suggested remediation actions.

**Root Detection**

Rooted devices can try to bypass security and may be more vulnerable to malicious apps. The SDK uses a multitude of detections to determine the status of the device, and checks for root management applications, potentially dangerous applications, and root cloaking applications.

**Device Risk Score**

The service provides a simple, flexible, and powerful risk scoring mechanism to ensure Webroot partners and end users are secure. When calculating a device score that partners can use to make a simple go/no-go decision, various attributes including whether the device is rooted, contains high-risk malware, and other criteria are taken into consideration.

**Runtime Permissions**

When using the mobile SDK in Android OS API level 23 (Marshmallow) or higher, runtime permissions must be accepted by a user. With this feature, partners can retrieve a list of required permissions and present any permissions that have not yet been accepted by the user.

Partners have access to all of these features, with the flexibility to adjust their configuration based on their unique needs. This flexibility allows partners to leverage the SDK in various scenarios, such as:

- Mobile device management providers can bolster their customers' mobile security through enhanced protection
- Smartphone manufacturers, mobile network operators, and communications service providers can differentiate through pre-loaded security for their users, featuring their own brand
- Financial institutions and anti-fraud providers can protect their customers' mobile transactions by ensuring that devices transacting with their systems are within acceptable risk levels

**Partner Integration Options**

Webroot follows established Android app development standards to help make SDK implementation simple in partners' solutions. Webroot partners are responsible for developing all UI components (both client and management interface) using the SDK and leveraging only the functionality needed for their use case.

The SDK solution consists of access to an online Gradle repository and actively maintained documentation that includes details all of the classes and interfaces in the library. In addition to Android-native integration into the apps, developers can quickly access the latest changes and choose whether to accept cutting-edge features or stay with well-established components. Webroot follows a lifecycle model in alignment with Google to ensure actively supported Android OS versions remain compatible as Android continues to tighten compliance and security requirements.

APIs allow for full management of all of the SDK security functions. For example, the partner can configure:

- Scan settings
- Real-time protection settings
- Quarantine

About Carbonite and Webroot

Carbonite and Webroot, OpenText companies, harness the cloud and artificial intelligence to provide comprehensive cyber resilience solutions for businesses, individuals, and managed service providers. Cyber resilience means being able to stay up and running, even in the face of cyberattacks and data loss. That's why we've combined forces to provide endpoint protection, network protection, security awareness training, and data backup and disaster recovery solutions, as well as threat intelligence services used by market leading technology providers worldwide. Leveraging the power of machine learning to protect millions of businesses and individuals, we secure the connected world. Carbonite and Webroot operate globally across North America, Europe, Australia, and Asia. Discover cyber resilience at [carbonite.com](http://carbonite.com) and [webroot.com](http://webroot.com).
